

Video surveillance system or closed circuit television (CCTV) is a system that uses video cameras to monitor and record activities in specific areas, with the aim of securing sites and protecting them from encroachment and theft, or to monitor the progress of work. The images and videos captured by the cameras are transferred to display screens or storage devices for later viewing. These systems are used in public and private places such as residential buildings, shops, factories, and public facilities to enhance security and safety.

Three Axis designs surveillance systems by installing cameras of various shapes and types to suit the nature and needs of each company and programs (NVR - DVR) where we enable the responsibility of seeing the place from the outside.
